Oxytocin (MPS)

Oxytocin

② - ③

Stop after 1 day

Do's:

- ✓ Make Self-Care a Priority
- ✓ Eat a Balanced Diet with plenty of foods rich in Iron and Vitamin D
- ✓ Use Mild Paraben and Sulfate free shampoos
- ✓ Make an appointment to see a Dermatologist if the problem lasts longer than six months.

Don'ts:

- X Do not skip meals
- X Don't excessively comb your hair with fine bristle combs
- X Refrain from oiling and massaging the scalp
- X Avoid heat and chemicals for hairstyling

ALLERGEN PANEL-Veg+Non Veg.+Inhalant+Drugs

(Method: Chemiluminescence)

Total IgE

816

IU/mL

< 160

General information:

Immunoglobulin E (IgE) is the most important antibody for allergic information. The level of IgE antibody is low during the first year of birth, gradually increases with age and reaches adult levels after teenage years. As IgE is a mediator of allergic response, quantitative measurement can provide useful information for differential diagnosis of sensitive and non-sensitive allergic disease. Patients with sensitive allergic diseases like Allergic asthma, Allergic rhinitis & Allergic dermatitis have moderately elevated IgE levels.

Useful for:

- Evaluation of children with strong family history of allergies and early clinical signs of disease
- Evaluation of children and adults suspected of having allergic respiratory disease to establish the diagnosis and define the allergens
- Confirm to clinical expression of sensitivity to foods in patients with Anaphylactic sensitivity or with Asthma, Angioedema or Cutaneous disease
- To evaluate sensitivity to insect venom allergens particularly as an aid in defining venom specificity in those cases in which skin tests are equivocal.
- To confirm the presence of IgE antibodies to certain occupational allergens

Elevated IgE levels:

- Sensitive and non-sensitive allergic disease
- Hyper IgE syndrome
- Parasitic infections
- IgE Myeloma,
- Pulmonary Aspergillosis,
- Immunodeficiency states
- Autoimmune diseases

Limitations:

- Normal levels of IgE do not rule out possibility of IgE dependent allergies as the diagnostic sensitivity of the test depends upon elapsed time between exposure to an allergen and testing, patient age and affected target organs.
- No close correlation has been demonstrated between severity of allergic reaction and IgE levels.

CLINICAL BIOCHEMISTRY _

Test Description

HOW TO INTERPRET YOUR RESULTS

- **Elevated values >0.50 IU/mL**
This indicate strong antibody reaction| stop intake of these foods immediately . Choose alternative food from the same group. Consult your physician
- **Borderline value 0.35 - 0.50 IU/mL**
This indicate mild to moderate antibody reaction| Reduced the intake of these foods for attest of 3 months Choose alternative food from the same group
- **Normal values <0.35 IU/mL**
This indicate no significant antibody reaction| No dietary restriction if there is no previous history of reaction if Symptomatic ,consult your physician even though the it is negative

Limitations : Cross-reacting carbohydrate determinants (sCCDs) are responsible for the phenomenon of cross-reactivity of sera from allergic patients towards wide range of allergens from plants and insects. In serum based allergy diagnosis, antibodies of the class directed against CCDs therefore give the impression of polysensitization. Diagnostic results caused by CCPs are there regarded as false positives.

Notie:

1. All results should be interpreted in relation to the individual case history
2. Food allergy is IgE mediated
3. This assay does not test any intolerance arising due too enzyme deficiency or chemical sensitivity
4. Some individuals may show positive for many food item, which could be due to local gut pathologist is recommended consult your physician
